

SHOOT PLAN

Luminous Rooftop Solar Installation — Video Shoot Plan

Two-day production covering installation and commissioning

PREPARED FOR Luminous (Manali)	PREPARED BY GRX10	DATE 2 July 2026
-----------------------------------	----------------------	---------------------

OVERVIEW

Objective

Document the complete Luminous rooftop solar journey — from design to live generation — across a two-day shoot at the customer site, covering all five stages outlined by the Luminous team.

COVERAGE MAPPING

Coverage vs. Luminous Ask

Luminous Coverage Step	Our Coverage	When	Source
1. Pre-installation	Design walkthrough (2D/3D layout with shading analysis); optional pre-install site survey	Pre-shoot	B-roll / stock + on-site (optional)
2. Installation	Truck roll-in, safe unloading, material overview, structure assembly, waterproofing, panel fixing, DC and AC cabling	Day 1	On-site
3. Integration	AC connection to meter; meter replacement (subject to meter availability, else stock footage)	Day 1	On-site / stock
4. Commissioning	DISCOM inspection (role play), system turn-on, app showing live solar generation	Day 2	On-site + B-roll
5. Final	Live generation and customer handover / testimonial (to be confirmed — see open items)	Day 2	On-site

SHOOT FLOW

Detailed Shoot Flow

Stage 1 — Design (Pre-Shoot)

Captured before the install days using B-roll or stock footage.

- Design shared with the customer in 2D or 3D format, including shading analysis of the rooftop.
- Screen captures / renders of the proposed layout to visually anchor the design step.

Stage 2 — Pre-Install Survey (Optional)

Subject to Luminous confirmation on whether this step should appear in the film.

- Luminous representative in a Luminous t-shirt visits the site.
- Measures the available install area using a tape measure.
- Assesses trees and other obstructions affecting the installation.

Day 1 — Installation

Full install-day coverage in sequence:

1. Truck roll-in with equipment and safe unloading of panels.
2. Structure assembly — digging the terrace to set latches, followed by waterproofing.

-
3. Structure build-up using welding and riveting.
 4. Panel mounting on the completed structure.
 5. DC cabling — routing cables from the panels to the inverter.
 1. AC cabling — connecting the inverter output to the meter.
 2. Meter replacement — installation of the final meter.

Meter replacement is subject to meter availability on site on the shoot day. If unavailable, stock footage will be used for this step.

Day 2 — Commissioning

1. DISCOM inspection — staged as a role play.
2. Connection turn-on.
3. App view showing live solar generation — captured as B-roll; can be shot off-site.

SCHEDULE

Schedule & Duration

- Tentative start: 6 July 2026 (to be confirmed).
- Planned duration: 2 days (Day 1 install + Day 2 commissioning).
- If the install runs longer than one day, the shoot extends to the install duration plus one additional day for commissioning.

CONFIRMATIONS

Open Items — Confirmation Needed from Luminous

1. Pre-install survey: should this step be included in the film? (Optional in our plan.)
2. Meter availability on site on Day 1 — determines live footage vs. stock for meter replacement.
3. Shoot dates — tentative 6 July, to be confirmed.
4. Customer handover and testimonial — confirm whether these are to be captured on Day 2.

NEXT STEPS

Next Steps

1. GRX10 to connect with Manoj and align Day 1 / Day 2 requirements.
2. Share this shoot plan and confirmed dates with Manali.
3. Proceed with the shoot only after Manali's approval of the plan.
